All the luster of having the big beats on the radio and the crazy dance-party vibe in the nightclubs fall right in line with the album's theme. That's all we can say about Ludacris all year long. You can hear his new album at the coupling constant can be obtained from the superpotential. The anomalous dimensions in the minimal models differ from the SYM calculation by a factor of 4. The reason is that there is a difference in the leading term in the anomalous dimensions. In the SYM,  $g$  is a perturbative mass parameter, and the leading term of the coupling constant is  $g^2$ . In our perturbation,  $g$  is a non-perturbative parameter, so the leading term in the gauge coupling is  $g^2/p^+$ , where  $p^+$  is the UV momentum scale. The structure of the anomaly equations is otherwise the same, and we get the same anomalous dimension  $\gamma=-1$ . This is in contrast to the relation between the  $N=1$  SYM and the LGT. The structure of the anomaly equation is consistent with the fact that the PS
